## – No Need For Compromise

In terms of the interior fit-out of buildings, re-shaping spaces and meeting the needs of the modern work environment are bringing new challenges for contractors and installers. Wall, ceiling and partitioning options are increasingly significant for end-users, building owners and specifiers.

Suspended ceiling design options remain popular; whether it's a small and simple suspended ceiling, a whole re-arranged office, or full-scale interior refurbishment or brand new fit-out. Ceiling design is critical for any building and it has become increasingly important to achieve the right balance of aesthetic finish, provision of services/ utilities and access, at the right cost.

For installers, the availability of these products, their adherence to industry standards and competitive pricing is leading to more demanding and rigorous sourcing of quality suppliers.

Recognising this, SAS International launched a new product into the UK market which is now available through distributors Mikor, Plastamasta and Statewest Interior Supplies throughout Australia. SAS Tee Grid offers a traditional ceiling grid finish providing a strong modular and tegular effect ceiling.

It is one of the highest galvanised steel content grid products on the market. Double stitched for strength and rigidity, it is available in T15 with a 36mm deep cross runner. Stainless steel clips ensure connections are strong and durable between cross tees and main runners. This lightweight system can support additional loads such as services up to 3kg and has a strong modular appearance.

Pricing is hugely critical to installers in the current climate. This product is one of the most cost efficient products available. Manufactured in accordance with ISO 9001 and 14001 international standards, strict quality testing procedures are employed during manufacture, and the products are fire tested in accordance with Australia's and New Zealand's standard AS/NZS 3837:1998.

Recognising contractors and installers are keen for product warranty, the company guarantees the quality and performance of all ceiling tile products used with its Tee Grid product, provided best practice construction is followed.

Time and waste savings are also recognised. The Tee Grid components are supplied in specially designed boxes, to be opened on its face by tearing off a tab strip. This means product can be accessed through the opening and the remainder stays safely protected in the box whilst other work is being carried out, both helping to reduce damage or loss on site.

Finally, the lightweight nature of this product provides an option which is easy to install, an important consideration in terms of time and resourcing on any project. A reassuring 'click' as each clip locks Tee Grid lengths into place, ensures a safe and secure grid installation.
